Psycholinguistics

This course provides a basic overview of how the mind and the brain process language. The main aim of the course is to provide an introduction to core areas of psycholinguistics: speech perception, word recognition, language comprehension, language production, first language acquisition, bilingualism, language disorders and aphasiology. There are two goals of this course: the first goal is to introduce students to the key findings and central debates within psycholinguistic research. The second goal is to introduce students to the tools and methods of psycholinguistic research (participants will have to prepare an oral presentation).

Time: see KIS: Sozialwissenschaften/Psycholinguistik und Sprachentwicklung
